Khobistskali is one of the most important riverine artery. There are populated territory with variety agricultural buildings in the middle and down side of the river. Also, there are transport roads, electricity lines , piping in the zone of the river and so on . Current climatic tendency has a big influence por river hydrological regime besides anthropogenic factors. Importantly increased interest of using river resources as communal as living side.

So, there are lots of problems which are connected with using river resources. The aim of our work was to estimate potential of Khobistskali river for agricultural work.

Poo in our work it is discussed pool of Khobistskali river general physical and geographical features, main reporting parameters and resources of some little pool rivers.
