Annotation

In the sciences of landscape and modern theoretical geography, the main prerequisite for individual and original works is the discussion of their distinction and the reviewing of a new research question. This implies an original and new understanding of the problems, discussion, review and evaluation. In the assessment we use traditional and modern knowledge, which has long been accumulated in the form of methodologies and factual materials. As a material, the most important for spatial science is graphic and visual material, which has been preserved as a result of past research or other activities. The study of Colchis may not be new, but novelty is the approach we have proposed to try and make the Colchian landscape different and more relevant. Therefore, in order to assess the potential distribution and the closer boundaries of the Colchian landscapes, we tried to evaluate both the physical and geographical, the socio-geographical and historical-ethnographic, as well as cultural and archaeological approaches. GIS analysis and geographic evaluation are a secondary stage based on interdisciplinary issues. Which, on the one hand, worked on the work to complete the work, and on the other hand, the final unifying feature was loaded into the composition of the synthesis and the content of the cartography. The study of Colchis and Colchis landscapes began with a deep historical epoch, and the range of studies includes a long interval of time. The ecological, biogeographical, soil-ethical, socio-political, ethnological, archaeological and cultural indicators of the Colchian landscape are estimated to be evaluated by cartographic materials. The time interval is quite large (several millennia), and the field of study is quite extensive and diverse. Therefore, research and work on the subject should continue in the future; work may be required in the future, both informally and through the content of the content. But we believe that this is good, because the study of such an interesting question requires further development and continuation of research. The work is interesting as its interdisciplinary and its practical and innovative nature. Colchic landscape as a single organism, its ecological and cultural elements, for recognition and popularization. The Colchic traditional life and the development and improvement of those values that are historical and cultural value for our country, and the rich, diverse ecosystems and cultural elements of the world, which can become a prerequisite for growing awareness of Georgia.
