Abstract.

The presented work deals with the geo-ecological problems of the European region and their cartographic analysis

Information on current experience and theoretical analysis is discussed. Review of local and international experience.

The paper describes geographical, ecological and landscape analysis of the study region. The main pollutant factors of the region are also reviewed..

The work is based on already drawn maps. Produced their cartographic and geostatic analysis. Here we are talking about cartographic images, such as: maps, cartograms, block diagrams , different types of diagrams (spherical and column) and graphs.

In the thesis authors have used scientific-cartographic literature, geographical literature, Thematic maps, international reports on geochemical problems and internet sites.
